
Valent Truss Support

Save labor with our Valent Truss Support

After a few weeks the first clusters will appear on the tomato plants. These clusters are very vulnerable and because of its weight the stem could kink easily. The quality of the tomatoes will be negatively affected and the cluster may not grow to full size. Valent Truss Support clips prevent the clusters from kinking. The clips are attached around the cluster stem, giving it support and ensuring better fruit quality and higher production.

Because of its flexibility the Valent Clips are easily attached around the stem of the clusters and there is minimal risk of damage to the plant. The updated model of the clip has rounded edges that will not pierce the fruit or plant causing damage.

Advantages of the Valent Truss Support:

- Rounded ends to minimize the risk of damage to the plant
- Better design adapted to the tomato plant
- Softer and more flexible for the plant and worker, no damage to the plant and will not hurt your employees' hands
- The clips are easy to apply saving you labor
- BIO Certification Industrial Compost TUV worldwide for the Valent Bio Truss Support
- Less plastic due to unique design and lower CO2 footprint
- Valent brand under Royal Brinkman and patented concept

The Valent Truss Support Clips are internationally tested and developed in the USA, Canada, Australia and the Netherlands.

The clips are developed with and improved by growers.
